

Tableau → Power BI

end to end, automated

BI migrations were always expensive: the front-end had to be rebuilt by hand. Recent work on TMDL, semantic modeling, and the Power BI Desktop Bridge changes that.

16 real dashboards, migrated by an agent pipeline.

The Price of Prosperity

Global CO2, GDP, and population. Migrated end to end and validated.

AFTER · Power BI (migrated)

BEFORE · Tableau (source)

2018 world population

7.636.740.830 · matches the source exactly

Health Tracker

Nine KPI cards, each with a 7-day trend that highlights the latest day.

AFTER · Power BI (migrated)

BEFORE · Tableau (source)

The bug from slide 6, fixed

9 of 9 cards highlight the latest day · every KPI exact

NL Wind Energy Utilization

A wind fleet dashboard; Tableau's polar spiral rebuilt as DAX X/Y measures.

AFTER · Power BI (migrated)

BEFORE · Tableau (source)

✓ Total actual output
453,167.284 MWh · 169,031.37 t CO2 saved

How it works

A deterministic parser feeds four Copilot CLI agents.

1 Deterministic parser

Tableau .twb XML → a schema-validated migration spec. No LLM guesswork here.

2 Semantic-model builder

Tables, relationships, and DAX (LOD expressions, table calculations).

3 Report builder

Native Power BI pages and visuals, laid out from the Tableau worksheets.

4 Fidelity validator

Independent and read-only. Compares every figure against the Tableau original.

One agent caught another agent's bug

The validator flagged it

On one dashboard, a “latest day” highlight was wrong: the Tableau source highlighted 9 of 9 cards, the Power BI render highlighted 0.

It found the root cause

An off-by-one in a date window: the “last week” range excluded the maximum date, so the highlighted day was filtered out.

It routed the fix, then re-verified

The model builder corrected the calc column; the fix was checked against ground truth and re-rendered. 9 of 9, matching Tableau.

That bug would have shipped silently.

AI-assisted. And honest about it.

Numbers match the source exactly. Models come out Copilot and Q&A ready. Every bug and capability gap found along the way is documented in the repo, not hidden.

Made possible by recent Microsoft work

Rui Romano and team: the Power BI Modeling MCP, TMDL, and PBIR (authoring a model and report as code).

The Power BI Desktop Bridge team (Emily Lisa, Harleen Kaur, Sara Lammini Rodriguez): the iterative open / refresh / screenshot loop this toolkit runs on.
